

LiNC-NXG Client Cloud (NXG CC)

Cloud-based Access Control Simplified

NXG CC is now available as a cloud-based application providing the same level of high security features found within the standard LiNC-NXG application with the added convenience of a user-friendly browser based interface. LiNC-NXG Client Cloud (NXG CC) provides automated processes with pre-program system parameters and controller configurations as well as cardholder information and the ability to manage the system from anywhere, at anytime. PCSC provides a system that eliminates the initial hassles of system setup and configuration. Unlike most cloud based access systems, PCSC offers two marketing options: use the PCSC NXG CC or create your own NXG CC Cloud system to manage the growth of your business, providing an additional marketing advantage over the competition.

The Client Cloud system eliminates the installation of client-side software and maintenance for your cus-

tomers. The user interface has been simplified allowing the end user the ability to manage their system with little or no support. System administration like software updates and database storage are automated via the Cloud.

Simple Configuration

PCSC's partners will appreciate the simplicity and effectiveness of the cloud based system especially during customer installation and setup. System parameters require little or no configuration, so all you will need to do is power it up. The cardholder's database is created by the end user and uploaded into the cloud through a Microsoft Excel cardholder file via a simple upload procedure. Authorization parameters are all configured with common default values and in most cases requires no additional programming.

LiNC-NXG Client Cloud

Cloud-based Access Control Simplified

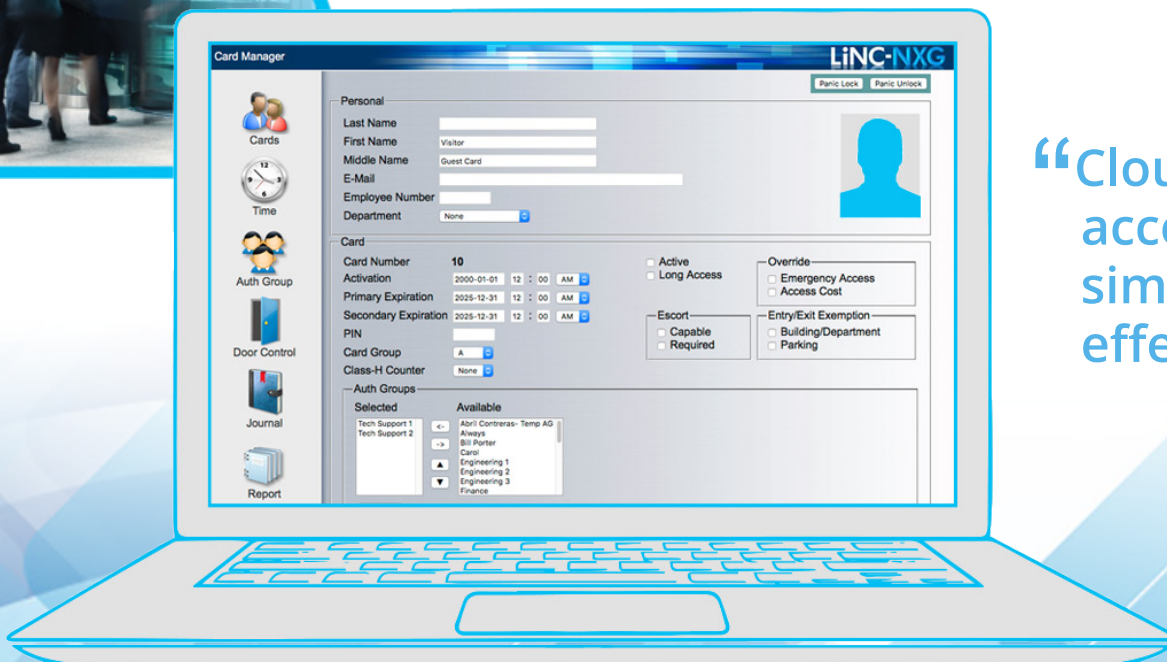

Designed to accommodate small to large business. Easily manage building security using a desktop or mobile device. Future-proof functionality with automatic updates at a fraction of the cost of on-site solutions. Eliminate the need for maintenance of local servers and software. Maximize potential with optional Remote Access Management as a Service.

Benefits & Features:

- Easy to Administer
- Automated Scheduled Report Mailing by Customer Needs
- Automated Customer's Data Backup
