PCSC | The Power of Access Control Excellence

In a world that thrives on connectivity, effective access control is critical to safeguarding both physical and digital assets. With a legacy spanning four decades, PCSC stands as a trusted partner to many businesses and OEMs worldwide, designing and manufacturing state-of-the-art access and security solutions. From advanced hardware and software to intelligent readers and input/output modules, it provides innovative and cost-effective access control for applications of any size.

PCSC's patented Fault Tolerant (FT) access controller is built to deliver improved performance for high-security environments. Designed to surpass industry norms, the FT architecture offers a level of reliability unparalleled in the market. The FT system, complemented by optional redundant communications, automatically recovers from communication or controller failures. This exceptional flexibility for high-security enterprise applications is unheard of in the industry.

There is also PCSC's flagship iQ Access Controller series, setting the benchmark for access control and input and output control monitoring. This series is a tried and true industry workhorse known for its performance and ability to safeguard facilities worldwide, whether under the PCSC brand or as OEM-provided solutions. These products offer clients the flexibility to choose between on-premise or cloud-based architectures to meet diverse needs.

"We feel secure credentials, paired with multi-technology readers and a solid access management system, are key. Our systems also integrate with many partner solutions for further features and enhancements," says Mas Kosaka, president and CEO of PCSC.

Mas Kosaka,
President and CEO

Amidst a plethora of access control options available in the market, clients often struggle to stay focused on their primary security goals and ensure long-term support. PCSC's solutions are an ideal alternative to costly, lesser-supported products offered by competitors. The team stands 100 percent behind each product offering and is dedicated to providing unparalleled service.

PCSC's proprietary network for localized support is entrusted with maintaining its legacy systems in operation worldwide while allowing smooth upgrades to future systems. By providing ongoing maintenance and upgrade opportunities, it enables clients to adopt new technologies without replacing existing controllers, limiting the end-of-life cycles of its access solutions and expanding market reach. Additionally, software maintenance programs are also available.

Adhering to the highest quality standards, PCSC's core products bear the coveted Underwriters Laboratories (UL) listing for access control (UL 294) and alarm monitoring (UL 1076) in the U.S. and Canada. In addition, these compliant solutions are IT-friendly, leveraging single cable ethernet, wireless communications,

Power-over-Ethernet (PoE), and even optional rack mountable enclosures.

PCSC's impact on the access control landscape is powerful and spans diverse sectors, evident in numerous success stories. It helped a large school district in the Western U.S. and a prominent hospital network in New England, collaborating with them and its own installer base to expand their systems in alignment with their evolving security needs. From global airports and military installations to financial institutions and industrial complexes, its solutions integrate seamlessly with other technologies and stand ready for future expansions.

“We feel secure credentials, paired with multi-technology readers and a solid access management system, are key. Our systems also integrate with many partner solutions for further features and enhancements”

With a commitment to delivering products marked by reliability and superior support, PCSC is redefining access control for the modern world. However, this wouldn't be possible without its team of innovative and ambitious engineers continuously developing new technology and products to meet and exceed expectations. As organizations strive for the highest levels of protection and efficiency, PCSC sets the bar for what is achievable, safeguarding the present and shaping the future of access control. **ES**
